Preface

About This Guide

The *Name-Value Pair API Developer Guide* describes the PayPal Name-Value Pair API.

Intended Audience

This guide is written for developers who are implementing solutions using the Name-Value Pair API.

What's New in Version 71.0

Changes to PaymentInfoType in DoExpressCheckoutPayment Response

PaymentInfoType Fields

Field	Description
PAYMENTINFO_ <i>n</i> _PAYMENTSTATUS	New value The status of the payment: <ul style="list-style-type: none">Completed-Funds-Held: The payment has been completed, and the funds have been added successfully to your pending balance.
PAYMENTSTATUS (<i>deprecated</i>)	
PAYMENTINFO_ <i>n</i> _HOLDDECISION	New field <code>xs:string</code> This field is available since version 71.0 and is returned only if PAYMENTINFO_ <i>n</i> _PAYMENTSTATUS is Completed-Funds-Held.. Is one of the following values: <ul style="list-style-type: none">newsellerpaymenthold -This is a new seller.paymenthold -A hold is placed on the seller's transaction for a reason not listed.

Changes to SellerDetailsType in DoExpressCheckoutPayment Response

SellerDetailsType Fields

Field	Description
PAYMENTREQUEST_n_SECUREMERCHANTACCOUNTID	Unique PayPal customer account number (of the seller). This field is returned in the response. This field is ignored if passed in the request.

PayPal NVP API Overview

This overview describes the PayPal Name-Value Pair (NVP) API at a high level.

- [“Introducing the PayPal NVP API” on page 11](#)
- [“Basic Steps” on page 12](#)
- [“Taking Your Application Live” on page 13](#)
- [“Technical Details” on page 14](#)
- [“Posting Using HTTPS” on page 18](#)

Introducing the PayPal NVP API

The PayPal NVP API is a simple programmatic interface that allows you, the merchant, to access PayPal’s business functionality to:

- Accept PayPal in checkout on your website using Express Checkout.
- Charge a credit card using Direct Payment.
- Capture payments previously authorized through Express Checkout, Direct Payment, or Website Payments Standard.
- Reauthorize or void previous authorizations.
- Pay one or more recipients using Mass Payment.
- Issue full refunds or multiple partial refunds.
- Search transactions using a start date or other criteria.
- View details of a specific transaction.

The PayPal NVP API makes it easy to add PayPal to your web application. You construct an NVP string and post it to the PayPal server using HTTPS. PayPal posts back a response in NVP format.

Integrating with PayPal API

You can develop with the PayPal NVP API using two different approaches:

Integrate Directly

You can integrate directly with the PayPal NVP API using the programming language of your choice. This is the most straightforward and flexible approach. You can download web samples that show how to integrate directly using Classic ASP, PHP, and ColdFusion.

Integrate Using an SDK

You can integrate with the NVP API using a software development kit (SDK). SDKs are provided for Java and ASP.NET. The SDKs provide simple functions for integrating with the NVP API.

Basic Steps

This section describes the basic steps for programming with the PayPal NVP API.

During application development, your application communicates with the PayPal Sandbox test environment. [“Taking Your Application Live” on page 13](#) describes how to move your application to the live PayPal environment.

Create a Web Application

Your NVP API implementation usually runs in a web application. You can write your own application or use one of the samples as a starting point.

Get API Credentials

To access the PayPal API, you need API credentials, either an API signature or API certificate, that identify you.

Use the following sample API signature and password in your sample programs that run in the PayPal Sandbox test environment.

NOTE: If you are using the samples, this signature is already in the code.

Details of the Sample API Signature

API username	sdk-three_api1.sdk.com
API password	QFZCWN5HZM8VBG7Q
API signature	A-IzJhZZjh929XQ2qnhapuwXIDzyAZQ92FRP5dqBzVesOkzbdUONzmOU

Create and Post the Request

Create an NVP request string and post it to PayPal sandbox server. Add code to your web application to do the following tasks:

1. URL-encode the name and value parameters in the request to ensure correct transmission of all characters. This is described in [“URL-Encoding” on page 14](#).
2. Construct the NVP API request string as described in [“Request Format” on page 15](#). The NVP format is described in [“NVP Format” on page 14](#).

3. Post the NVP request to the PayPal Sandbox as described in “Posting Using HTTPS” on page 18.

Interpret the Response

PayPal processes your request and posts back a response in NVP format. Add code to your web application to do the following tasks:

1. Receive the HTTP post response, and extract the NVP string.
2. URL-decode the parameter values as described in “URL-Encoding” on page 14.
3. Take appropriate action for successful and failed responses.

Taking Your Application Live

After you have finished coding and testing your application, deploy your application to the live PayPal server using your PayPal business account and API credentials for that account.

Set Up a PayPal Business Account

When you are ready to deploy your application to the live PayPal server, create a PayPal business account on <https://www.paypal.com>.

Set Up API Credentials

To use the APIs, you need a set of credentials to identify yourself to PayPal. Create an API signature for your business account.

For instructions on setting up API credentials for the business account, go to https://www.paypal.com/IntegrationCenter/ic_certificate.html.

IMPORTANT: If you are using API signature, you must protect the API signature values in your implementation. Consider storing these values in a secure location other than your web server document root and setting the file permissions so that only the system user that executes your ecommerce application can access it. The sample code does not store these values securely. *The sample code should never be used in production.*

NOTE: While API signature is recommended, you can also use API certificate.

Modify Your Code

The request and response are in URL-encoded format, which is defined by the Worldwide Web Consortium (W3C). URL is defined as part of the URI specification. Find out more about URI at <http://www.w3.org/Addressing/>.

Technical Details

This section describes details of the technologies used by the PayPal NVP API.

Request-Response Model

When you use the PayPal NVP API, you post an NVP request to PayPal, and PayPal posts back an NVP response.

URL Format

The request and response are in URL-encoded format, which is defined by the Worldwide Web Consortium (W3C). URL is defined as part of the URI specification. Find out more about URI at <http://www.w3.org/Addressing/>.

NVP Format

NVP is a way of specifying names and values in a string. NVP is the informal name for the query in the URI specification. The NVP string is appended to the URL.

An NVP string conforms to the following guidelines:

- The name is separated from the value by an equal sign (=). For example:

```
FIRSTNAME=Robert
```

- Name-value pairs are separated by an ampersand (&). For example:

```
FIRSTNAME=Robert&MIDDLENAME=Herbert&LASTNAME=Moore
```

- The values for each field in an NVP string are URL-encoded.

URL-Encoding

The request and response are URL-encoded. URL-encoding ensures that you can transmit special characters, characters that are not allowed in a URL, and characters that have special meaning in a URL, such as the equal sign and ampersand. For example, the following NVP string:

```
NAME=Robert Moore&COMPANY=R. H. Moore & Associates
```

is URL-coded as follows:

```
NAME=Robert+Moore&COMPANY=R%2E+H%2E+Moore+%26+Associates
```

Use the following methods to URL-encode or URL-decode your NVP strings:

URL-Encoding Methods

Language		Method
ASP.NET	Encode	<code>System.Web.HttpUtility.UrlEncode(buffer, Encoding.Default)</code>
	Decode	<code>System.Web.HttpUtility.UrlDecode(buffer, Encoding.Default)</code>
Classic ASP	Encode	<code>Server.URLEncode</code>
	Decode	No built-in function. Several implementation examples are available on the Internet.
Java	Encode	<code>java.net.URLEncoder.encode</code>
	Decode	<code>java.net.URLDecoder.decode</code>
PHP	Encode	<code>urlencode()</code>
	Decode	<code>urldecode()</code>
ColdFusion	Encode	<code>URLEncodedFormatstring [, charset]</code>
	Decode	<code>URLDecodeurlEncodedString[, charset])</code>

Request Format

Each NVP request consists of required and optional parameters and their values. Parameter names are not case sensitive. The examples in this document use UPPERCASE for parameter names and divide the parameters into required security parameters and body parameters.

General Format of a Request

Required Security Parameters	<code>USER=apiUsername</code> <code>&PWD=apiPassword</code> <code>&SIGNATURE=apiSignature</code> <code>&SUBJECT=optionalThirdPartyEmailAddress</code> <code>&VERSION=56.0</code> The following parameters are always required: USER PWD VERSION The examples show the required security parameters like this: <code>[requiredSecurityParameters]</code>
Body Parameters	<code>&METHOD=methodName</code> <code>&otherRequiredAndOptionalParameters</code>

In practice, you need to concatenate all parameters and values into a single URL-encoded string. After the METHOD parameter, you can specify the parameters in any order.

Security Parameters

The security parameters are described below. These are your PayPal API credentials.

Required Security Parameters: API Credentials

Parameter	Value
USER	<i>(Required)</i> Your PayPal API Username.
PWD	<i>(Required)</i> Your PayPal API Password.
VERSION=<current version>	<i>(Required)</i> Version number of the NVP API service, such as 56.0.
SIGNATURE	<i>(Optional)</i> Your PayPal API signature string. If you use an API certificate, do not include this parameter.
SUBJECT	<i>(Optional)</i> Email address of a PayPal account that has granted you permission to make this call. Set this parameter only if you are calling an API on a different user's behalf.

IMPORTANT: You must protect the values for USER, PWD, and SIGNATURE in your implementation. Consider storing these values in a secure location other than your web server document root and setting the file permissions so that only the system user that executes your ecommerce application can access it.

The sample code does not store these values securely. The sample code should never be used in production.

You may see sample code where these values are stored in an HTML form. The following is an example of what you should NOT do in production:

```
<form method=post action=https://api-3t.sandbox.paypal.com/nvp>
<!-- UNPROTECTED VALUES. DO NOT USE IN PRODUCTION! -->
<input type=hidden name=USER value=xxxxxx.paypal.com>
<input type=hidden name=PWD value=abcdefg>
<input type=hidden name=SIGNATURE value=xxxxxxxxxxxxxxxxxx>
...
</form>
```

API Parameters

A response from the PayPal servers is a URL-encoded name-value pair string, just like the request, except it has the following general format.

General Format of a Successful Response

Success Response Fields	ACK=Success&TIMESTAMP=date/timeOfResponse &CORRELATIONID=debuggingToken&VERSION=... &BUILD=buildNumber
API Response Fields	&NAME1=value1&NAME2=value2&NAME3=value3&...

Each response includes the ACK field. If the ACK field's value is Success or SuccessWithWarning, you should process the API response fields. In a successful response, you can ignore all fields up to and including the BUILD field. The important fields begin after the BUILD field.

Error Responses

If the ACK value is Error or Warning, API response fields are not returned. An error response has the following general format.

Format of an Error Response

Response Fields on Error	ACK=Error&TIMESTAMP=date/timeOfResponse& CORRELATIONID=debuggingToken&VERSION=VersionNo& BUILD=buildNumber&L_ERRORCODE0=errorCode& L_SHORTMESSAGE0=shortMessage& L_LONGMESSAGE0=longMessage& L_SEVERITYCODE0=severityCode	Multiple errors can be returned. Each set of errors has a different numeric suffix, starting with 0 and incremented by one for each error.
--------------------------	--	--

For possible causes of errors and how to correct them, see the explanation of the specific error code, short message, and long message in [“API Error Codes” on page 171](#).

ACK Parameter Values

The following table lists values for the ACK parameter.

ACK Parameter Values

Type of Response	Value
Successful response.	Success SuccessWithWarning
Partially successful response (parallel payments implementations only). Some of the payments were successful.	PartialSuccess
Error response.	Failure FailureWithWarning Warning

Posting Using HTTPS

Your web application posts the URL-encoded NVP string over an HTTPS connection to one of the PayPal API servers. PayPal provides a live server and a Sandbox server that allows you to process transactions in a test environment.

API Servers for API Signature Security

If you use an API signature, post the request to one of these servers:

Sandbox: `https://api-3t.sandbox.paypal.com/nvp`

Live: `https://api-3t.paypal.com/nvp`

API Servers for API Certificate Security

If you use an API certificate, post the request to one of these servers:

Sandbox: `https://api.sandbox.paypal.com/nvp`

Live: `https://api.paypal.com/nvp`

2

AddressVerify API Operation

Confirms whether a postal address and postal code match those of the specified PayPal account holder.

- [“AddressVerify Request Message” on page 19](#)
- [“AddressVerify Response Message” on page 20](#)

AddressVerify Request Message

Address Verify Request Fields

Field	Description
METHOD	<i>(Required)</i> Must be AddressVerify.
EMAIL	<i>(Required)</i> Email address of a PayPal member to verify. Maximum string length: 255 single-byte characters Input mask: ?@? . ??
STREET	<i>(Required)</i> First line of the billing or shipping postal address to verify. To pass verification, the value of Street must match the first three single-byte characters of a postal address on file for the PayPal member. Maximum string length: 35 single-byte characters. Alphanumeric plus - , . ‘ # \ Whitespace and case of input value are ignored.
ZIP	<i>(Required)</i> Postal code to verify. To pass verification, the value of Zip must match the first five single-byte characters of the postal code of the verified postal address for the verified PayPal member. Maximum string length: 16 single-byte characters. Whitespace and case of input value are ignored.

AddressVerify Response Message

Address Verify Response Fields

Field	Description
CONFIRMATIONCODE	<p>None: The request value of the Email element does not match any email address on file at PayPal.</p> <p>Confirmed: If the response value of the StreetMatch element is Matched, the entire postal address is confirmed.</p> <p>Unconfirmed: PayPal responds that the postal address is unconfirmed.</p> <p>NOTE: The values Confirmed and Unconfirmed both indicate that the member email address passed verification.</p>
STREETMATCH	<p>None: The request value of the Email element does not match any email address on file at PayPal. No comparison of other request values was made.</p> <p>Matched: The request value of the Street element matches the first three single-byte characters of a postal address on file for the PayPal member.</p> <p>Unmatched: The request value of the Street element does not match any postal address on file for the PayPal member.</p>
ZIPMATCH	<p>None: The request value of the Street element was unmatched. No comparison of the Zip element was made.</p> <p>Matched: The request value of the Zip element matches the ZIP code of the postal address on file for the PayPal member.</p> <p>Unmatched: The request value of the Zip element does not match the ZIP code of the postal address on file for the PayPal member.</p>
COUNTRYCODE	Two-character country code (ISO 3166) on file for the PayPal email address.
TOKEN	<p>The token contains encrypted information about the member's email address and postal address. If you pass the value of the token in the HTML variable address_api_token of Buy Now buttons, PayPal prevents the buyer from using an email address or postal address other than those that PayPal verified with this API call.</p> <p>The token is valid for 24 hours.</p> <p>Character length and limitations: 94 single-byte characters.</p>

- [“DoCapture Response Message” on page 23](#)

DoCapture Request Message

DoCapture Request Fields

Field	Description
METHOD	<i>(Required)</i> Must be DoCapture.
AUTHORIZATIONID	<i>(Required)</i> The authorization identification number of the payment you want to capture. This is the transaction id returned from DoExpressCheckoutPayment or DoDirectPayment. Character length and limits: 19 single-byte characters maximum.
AMT	<i>(Required)</i> Amount to capture. Limitations: Value is a positive number which cannot exceed \$10,000 USD in any currency. No currency symbol. Must have two decimal places, decimal separator must be a period (.), and the optional thousands separator must be a comma (,).
CURRENCYCODE	<i>(Optional)</i> A three-character currency code. Default: USD.

Field	Description
COMPLETETYPE	<p>(Required) The value Complete indicates that this the last capture you intend to make.</p> <p>The value NotComplete indicates that you intend to make additional captures.</p> <p>NOTE: If Complete, any remaining amount of the original authorized transaction is automatically voided and all remaining open authorizations are voided.</p> <p>Character length and limits: 12 single-byte alphanumeric characters.</p>
INVNUM	<p>(Optional) Your invoice number or other identification number that is displayed to the merchant and customer in his transaction history.</p> <p>NOTE: This value on DoCapture will overwrite a value previously set on DoAuthorization.</p> <p>NOTE: The value is recorded only if the authorization you are capturing is an order authorization, not a basic authorization.</p> <p>Character length and limits: 127 single-byte alphanumeric characters.</p>
NOTE	<p>(Optional) An informational note about this settlement that is displayed to the payer in email and in his transaction history.</p> <p>Character length and limits: 255 single-byte characters.</p>
SOFTDESCRIPTOR	<p>(Optional) The soft descriptor is a per transaction description of the payment that is passed to the consumer's credit card statement.</p> <p>If a value for the soft descriptor field is provided, the full descriptor displayed on the customer's statement has the following format:</p> <pre><PP * PAYPAL *><Merchant descriptor as set in the Payment Receiving Preferences><1 space><soft descriptor></pre> <p>The soft descriptor can contain only the following characters:</p> <ul style="list-style-type: none"> • Alphanumeric characters • - (dash) • * (asterisk) • . (period) • {space} <p>If you use any other characters (such as “,”), an error code is returned.</p> <p>The soft descriptor does not include the phone number, which can be toggled between the merchant's customer service number and PayPal's customer service number.</p> <p>The maximum length of the total soft descriptor is 22 characters. Of this, either 4 or 8 characters are used by the PayPal prefix shown in the data format. Thus, the maximum length of the soft descriptor passed in the API request is:</p> $22 - \text{len}(\text{<PP * PAYPAL *>}) - \text{len}(\text{<Descriptor set in Payment Receiving Preferences>}) + 1$ <p>For example, assume the following conditions:</p> <ul style="list-style-type: none"> • The PayPal prefix toggle is set to PAYPAL * in PayPal's admin tools. • The merchant descriptor set in the Payment Receiving Preferences is set to EBAY. • The soft descriptor is passed in as JanesFlowerGifts LLC. <p>The resulting descriptor string on the credit card would be:</p> <pre>PAYPAL *EBAY JanesFlow</pre>

DoCapture Response Message

NOTE: If you use version 56.0 or later of the DoCapture API, only the authorization ID, transaction ID, transaction type, payment date, gross amount and payment status are guaranteed to be returned. If you need the values of other fields and they are not returned, you can obtain their values later by calling `GetTransactionDetails` or by using the reporting mechanism.

DoCapture Response Fields

Field	Description
AUTHORIZATIONID	The authorization identification number you specified in the request. Character length and limits: 19 single-byte characters maximum.

DoAuthorization API Operation

Authorize a payment.

- [“DoAuthorization Request Message” on page 23](#)
- [“DoAuthorization Response Message” on page 24](#)

DoAuthorization Request Message

DoAuthorization Request Fields

Field	Description
METHOD	<i>(Required)</i> Must be DoAuthorization.
TRANSACTIONID	<i>(Required)</i> The value of the order’s transaction identification number returned by PayPal. Character length and limits: 19 single-byte characters maximum.
AMT	<i>(Required)</i> Amount to authorize. Limitations: Value is a positive number which cannot exceed \$10,000 USD in any currency. No currency symbol. Must have two decimal places, decimal separator must be a period (.), and the optional thousands separator must be a comma (,).
TRANSACTIONENTITY	<i>(Optional)</i> Type of transaction to authorize. The only allowable value is Order, which means that the transaction represents a customer order that can be fulfilled over 29 days.
CURRENCYCODE	<i>(Optional)</i> A three-character currency code. See “Currency Codes” on page 259 .

DoAuthorization Response Message

DoAuthorization Response Fields

Field	Description
TRANSACTIONID	An authorization identification number.
AMT	The amount you specified in the request.

AuthorizationInfo Fields

Field	Description

- [“DoReferenceTransaction API Operation” on page 151](#)

CreateRecurringPaymentsProfile API Operation

Create a recurring payments profile.

You must invoke the `CreateRecurringPaymentsProfile` API operation for each profile you want to create. The API operation creates a profile and an associated billing agreement.

NOTE: There is a one-to-one correspondence between billing agreements and recurring payments profiles. To associate a recurring payments profile with its billing agreement, the description in the recurring payments profile must match the description of a billing agreement. For version 54.0 and later, use `SetExpressCheckout` to initiate creation of a billing agreement.

10411	This Express Checkout session has expired.	This Express Checkout session has expired. Token value is no longer valid.	If you receive this error, you must return your customer to PayPal to approve the use of PayPal again. Display an error message to inform the customer that the transaction expired, and provide a button to return to PayPal. In this situation, you are effectively restarting the entire checkout process. (Do not reuse the expired token value on SetExpressCheckout request.) However, because you already know the final OrderTotal, be sure to update the value for that element if appropriate. You might also want to update the values for ReturnURL and CancelURL, if necessary.
10412	Duplicate invoice	Payment has already been made for this InvoiceID.	PayPal checks that InvoiceID values are unique for any particular merchant. If you send an InvoiceID value already associated with another transaction in the PayPal system, PayPal returns error code 10412. You might not be able to correct this error during an actual checkout. If you get this error, research why might occur and modify your implementation of Express Checkout to ensure that you generate unique invoice identification numbers.
